                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 CAAGGGTTCGAAATAAAGGAATAAATTCGTGA 32
                                                                        NOTE: This is a PHASE2 sequence. Gaps are shown by mnnnn. Genes were identified by a combination of several methods: Gene prediction programs including Figeness (http://www.softberry.com/), genscan (http://CCR-081.mit.edu/GENSCAN.html), GeneMarkHMM (http://genemark.biology.gatech.edu/GENSCAN.html), GeneMarkHMM (http://genome.wustl.edu/eddy/tRNAscan-SE/), searches of the complete sequence against NCBI none redundant protein database (nr) (ftp://ncbi.nlm.nih.gov/blast/db) and the EST database at NCGR.

* NOTE: This is a 'working draft' sequence. It currently 'consists of 2 contigs Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the spass between them are based on estimates that have 'This sequence will be replaced to replaced to replaced with sequence will be replaced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CAAGGGTTCGAAATAAAGGAATAAATTCGTGA 32

E-mail enquiries thunguery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk On Apr 7, 2002 this sequence version replaced gi:17976640. During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one Ml3 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em: EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The true right end of clone ZK856 is at 104 in sequence Z73969.

The start of this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Current sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note.

IMPORTANT: This sequence is not the entire insert of clone ZK856. It may be shorter because we only sequence overlapping sections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                overlapping sections once, or longer becauverlap between neighbouring submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Submitted (16-APR-1996) Nematode Sequencing Project, Sanger Institute, Hinxton, Cambridge CB10 15A, England and Department of Genetics, Washington University, St. Louis, MO 63110, USA. (see http://www.hgsc.bcm.tmc.edu/docs/Genbank draft data.)
NOTE: This is a 'working draft' sequence. It currently
consists of 11 contigs. The true order of the pieces
is not known and their order in this sequence record is
arbitrary. Gaps between the contigs are represented as
runs of N, but the exact sizes of the gaps are unknown.
This record will be updated with the finished sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  as soon as it is available and the accession number will be preserved.

NOTICE: This sequence may not be the entire insert of thi It may be shorter because we only sequence overlapping seconce, or longer because we provide a small overlap between neighboring submissions. **Bections**

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one m13 subclone.

For a graphical representation of this cosmid sequence and its analysis see: www.wormbase.org/db/seq/sequence?name=Y69A2AR;class=Sequence)

NEIGHBORING COSMID INFORMATION

cosmid is Y69A2AL, 200 ģ overlap; the ų cosmid 18 Y94H6A,

Coding seqences below are the result of integration and manual review of the following data: computer analysis using the progra Genefinder (P. Green and L. Hillier, personal communication), the large scale EST projects of Yuji Kohara (http://www.ddbj.nig.ac.jp/c-elegans/html/CE_INDEX.html) and The program

Sequence Validation: This sequence has been validated by Multiple Complete Digest fingerprinting. Comparison of the experimentally derived digest fragments with sequence-predicted fragments is given below. The electronically-digested sequence consists of both insert and vector, in order to accurately represent the entire circular BAC. Small fragments below a variable cutoff (approximately 400-800 bp) are not resolved in the fingerprint and hence do not appear in the table. There are no significant remaining discrepancies between the experimental and predicted values. Uniquely ordered fragments are separated by dashed lines. HindIII SeqDerMap FngrPrnt SeqDerMap FngrPrnt SeqDerMap FngrPrnt SeqDerMap FngrPrnt SeqDerMap FngrPrnt SeqDerMap FngrPrnt 11	Consensus quality: 206318 bases at least Q20 Insert size: 206320; sum-of-contigs Quality coverage: 6.7x in Q20 bases; sum-of-contigs Overlapping Sequences: 5: Mapping in progress 3: RP11-70220 (UWGC:bc0189) AC016944 Sequence Quality Assessment: This entry has been annotated with sequence quality estimates computed by the Phrap assembly program. All manually edited bases have been reduced to quality zero. Quality levels above 40 are expected to have less than 1 error in 10,000 bp. Base-by-base quality values are not generally visible from the GenBank flat file format but are available as part of this sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., Phred quality -= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. NOTE: This is a 'working draft' sequence. It currently consists of 10 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as arbitrary. Gaps between the contigs are represented as LOCUS runs of N, but the exact sizes of the gaps are unknown.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a guide desoxynucleotide building block, which was used to link directional desoxynucleotide building blocks during construction of chimeric promoters of the invention. The specification describes chimeric expression promoters. These chimeric promoters construction describes chimeric expression promoters. These from a first plant promoter, in which a plant vascular expression promoter region is replaced with a nucleic acid sequence derived from a second plant promoter comprising a plant green tissue expression promoter region. Preferably, the first plant promoter originates from Commelina yellow mottle virus, and the second plant promoter are derived from intergenic regions. The chimeric promoters are derived from intergenic regions. The chimeric promoters are useful for producing transcenic regions.
                  The method is for isolating a chemically regulatable DNA promoter fragment from the 5' flanking region of a chemically regulatable gene a plant tissue. The method allows isolation of sequences which will be useful for the controlled expression of genes, under the control of a
                                                                                                                                                                                                                                                                                                                                 31-MAY-1995;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC chemical regulator, the regulator being applied before or with the CC chemical regulator, the regulator being applied before or with the CC chemical regulator, the regulator being applied before or with the CC cheight or pesticide to give optimal tolerance. The promoter fragment CC is useful for controlling sequences which encode traits such as CC height, shape, development, male or female sterility, and the ability CC of the plant to withstand cold, heat, salt and drought. The chemical CC industrion of the promoter allows the regulation of production of CC compounds, e.g. flavours, fragrances, pigments, natural sweeteners, CC industrial feedstocks, antimicrobials and pharmaceuticals, by the object of the second cold, whose biosynthesis is controlled CC by endogenous or foreign genes. The method allows control over the time CC contract of gene expression either throughout the whole plant, or in CC localized tissues, to achieve e.g. fungal or insect resistance by for CC contract controlling the chemical regulator. Controlling the Cdevelopmental processes by the application of a regulating chemical in CC e.g. the commercial production of cultivated crops allows processes such as germination, flower formation and fruit ripening to be synchronised at CC and the control of cultivated crops allows processes such control in the control of cultivated crops allows processes such control in the control of cultivated crops allows processes such control in the control control in the control con

Also described are: (1) a chimeric gene comprising the above DNA molecule linked to a heterologous promoter; (ii) a vector containing the chimeric gene; (iv) a transgenic plant containing the chimeric gene; die chimeric gene; and (v) a seed from the transgenic plant to DNA molecule is used to produce transgenic plants with enhanced disease or pest resistance. The present sequence represents a tobacco

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         xylanases, beta-glucanase cellulases or feruloyl esterases. These enzymes improve the digestibility of vegetable sources (particularly cereals). Supplementation of the diets of pigs with xylanase increased the energy digestibility by at least 6% as compared to unsupplemented diets, indicating that the enzyme is increasing the breakdown of cell walls (particularly those of wheat), causing the release of additional food energy in the small intestine. The enzyme mixture from the novel penicillium funiculosum strain is used for feeding livestock, especially by improving the digestibility of cereals such as wheat, rye, barley, triticale, oat, rice, oil seeds such as soya, sunflower, rapeseed, and cereal by-products such as wheat bran. The novel enzymes decrease by-products such as wheat bran.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents Penicillium funiculosum genomic DNA encoding xylanase C. The invention relates to a novel strain of Penicillium funiculosum, deposited under the Budapest treaty as IMI No. 378536,
                                                                                                                                                                                                                                                                                                                                                                                                           Staphylococcus epidermidis SR1 strain; infection; diagnosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                               S. epidermidis genomic polynucleotide sequence SEQ ID NO:3462
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2283 ĠĠĠŤŤTAĀĀĀŤĀĀĀTĀĀĀŤĀĀŤĀČŤŤĠĀ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          C(I) and (II) can have antibacterial activity and therefore can be used C in vaccination. The nucleic acids (I) may be used to produce the C s. epidermidis polypeptides (II) via the production of vectors C containing them which are used to produce hosts cells which express the C containing them which are used to produce hosts cells which express the C used to vaccinate subjects and to raise antibodies against the bacteria. C The polypeptides may also be used to assay for other inhibitors of their c activity and therefore identify compounds that may be used for the C treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA C AAH55098 represent oligonucleotide sequences and primers which are used in the exemplification of the present invention. AAH55091 to C N.B. The present invention appecifically claims all the polynucleotide sequences from the present invention, the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4455 to 4472, on commonces are wrateners for EPA IN NO.4455 to AA452.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (I) and, (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria.
                                                                                                                                                                                                                                                                                                                                               Nucleic acids encoding polypeptides from Staphylococcus epidermidis, useful for vaccinating against infections, e.g. endocarditis -

in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55091 to AAH55098 represent oligonucleotide sequences and primers which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 44 no sequences are present for SEQ ID NO:4465 to 4464.
                                                                                                                                                                                                                                                                                                                                                    Nucleic acids encoding polypeptides from Staphylococcus epidermidis, useful for vaccinating against infections, e.g. endocarditis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Staphylococcus epidermidis SR1 strain; infection; diagnosis; vaccination; endocarditis; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  S. epidermidis genomic polynucleotide sequence SEQ ID NO:3997
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1603
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55091 to AAH55090 represent oligonucleotide sequences and primers which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                Claim 8; Page 1670-1671; 2188pp;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472,
                                                                                                                                                                                                                                                                                          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The inventiuseful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-ABB72072).

```

```
cc amplification method for detecting specific single stranded target conucleic acids in samples using a plurality of probe sets comprising at cleast 2 probes. Each probe comprises a target specific region and a conn-complementary region comprising a primer binding site. The probes conplished by a primer set. The method is used for detecting a nucleotide polymorphism, especially a single nucleotide polymorphism; detecting multiple single stranded target nucleic acid sequences (through the cetection of multiple amplicons); determining the absolute or relative abundance of multiple single stranded nucleic acids in a sample; and detection of a break point region in rearranged nucleic acids. By using a femtomolar amount of the probes, a large number of different probe sets can be used to simultaneously detect and quantify a corresponding clarge number of target sequences with high specificity. The present DNA sequence is human ribosomal protein S24 probe which is used in a multiplex ligatable probe amplification (MLPA) assay.

Novel isolated nucleic acid molecule associated with cancerous state prostate cells and correlating with presence of prostate cancer, use for detecting presence of prostate cancer, stage of prostate cancer

Page 11524; 11750pp; English.

The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for:
(a) assessing whether a patient is afflicted with prostate cancer; monitoring the progression of prostate in a patient;

The invention

relates to an

improved multiplex ligation-dependent

                  The invention relates to a spatially-addressable set of single exornucleic acid probes for measuring gene expression in a sample derive from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. General management of the service of the microarray of the service of the microarray of the probes are useful for gene discovery, and for encode proteins of the microarray of the service of the microarray of the probes of the microarray of gene discovery, and for encode proteins predisposition and/or prognosing breast disease. General management of the probes of the microarray of the probes of the microarray of general discovery.

The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid

Note: The sequence data for this patent did not form part printed specification, but was obtained in electronic form from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                   Penn
                                                                                                                                    Claim 1;
                                                                                                                                                          analyzing
                                                                                                                                                                   Human genome-derived single exon nucleic
                                                                                                                                                                                            WPI; 2001-483447/52.
                                                                                                                                                                                                                                                                                                                                                         30-JAN-2001; 2001WO-US00669

                                                                                                                                                                                        The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and
